Make Your Cloud Great Again – Cloud Encryption with Cryptomator

Today, German startup Skymatic released Cryptomator 1.0 for Android. The encryption app allows users to protect their files securely and easily in any cloud storage.

Bonn, Germany – October 17, 2017 – Cryptomator makes cloud storages trustworthy. After one year of beta testing, Skymatic released Cryptomator for Android in the Google Play Store today.

Photos, company secrets, or the latest bank statement: Cryptomator allows users to securely store even sensitive data in the cloud. The easy-to-use app encrypts files on mobile devices before they are uploaded to the cloud storage. Access to encrypted files is equally effortless.

Cryptomator is the first open-source encryption solution for the cloud that is also user-friendly. The open-source encryption implementation ensures that the app does what it is supposed to do. No backdoors are implemented, no weaknesses are concealed. For its user-friendliness and transparency, Cryptomator received the *CeBIT Innovation Award 2016 for Usable Security and Privacy*.

In version 1.0 for Android, the app is compatible with Dropbox, Google Drive, OneDrive, and WebDAV-based providers. The app is available for \$4.99. Cryptomator is also available for Windows, macOS, Linux, and iOS.

About Skymatic

Skymatic is a startup from Bonn, Germany and was founded in 2016. The company is engaged with the topic “digital self-defense for everyone”. It has developed Cryptomator, a software that empowers users to protect their files in any cloud storage.

Skymatic is signatory of the *Charter for Fostering Trustworthy Communication* and member of the *Alliance for Cyber Security* by BSI (Federal Office for Information Security).
